DETAILED ACTION

1. The disclosure is objected to because of the following informalities: the examiner notes that there exists numerous grammatical errors and improper and incomplete sentence structures throughout the length of the specifications.

Appropriate correction is required.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 1-6 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

4. The claims are generally narrative and indefinite, failing to conform with current U.S. practice. They appear to be a literal translation into English from a foreign document and are replete with grammatical and idiomatic errors.

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

Art Unit: 2876

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. Claims 1-6 are rejected under 35 U.S.C. 102(b) as being anticipated by Higuchi et al. (US 5,132,808) (hereinafter referred to as 'Higuchi').

Higuchi teaches an image recording apparatus featuring a computer 2 having memory means for memorizing the code information of an original object P. The original P is supported on a stacker 202 and fed one by one to a reading conveyance 205 that by a paper-feeding roller 203 and a separating roller 204. The original P passes an original sensor 206 and the bar code 221 on the original P is read by a scanner 208 on the basis of a passage signal. The content of the read bar code is transferred to a CPU 209 and temporarily preserved in a memory 209a in the CPU 209. When the original P has passed an original discharge sensor 207, the bar code information is preserved in the memory 209a in the CPU 209. If the original P does not pass an original discharge sensor 207 in sufficient time, the CPU regards it as a jam of the original P between the original supply sensor 206 and the original discharge sensor 207 (col. 4, lines 40-53; col. 5, line 63-col. 6, line 11; and col. 13, lines 43-68).

Conclusion

7. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Uhling (US 6,199,765) teaches a printer media with bar code identification system.

Martinez Taylor (US 5,336,876) teaches a high-speed, gravity-fed document feeder for bar code scanner.
